

## a Difference

**Hepatitis C is the most common blood borne viral infection in the US.** If left untreated it can lead to serious liver problems such as cirrhosis or cancer. Baby Boomers represent nearly 77% of all adults living with Hepatitis C infection in the US.

The **Centers for Disease Control** recommends that Hepatitis C screening be a part of your yearly check up if you:

- were born between 1945-65.
- have received a blood transfusion prior to the year 1992.
- have a high risk exposure.

The test can be done as part of your routine blood work today.
